

 $\mathcal{V}(x,\pi)$

- parse π as $((\alpha_1,...,\alpha_k),(\tau_1,...,\tau_k))$
- derive IP randomness

$$\begin{array}{c} \times, \alpha_{1}, \tau_{1} \\ & \downarrow \\ \times, (\alpha_{1}, \alpha_{2}), (\tau_{1}, \tau_{2}) \\ & \downarrow \\ \times, (\alpha_{1}, \alpha_{2}, \alpha_{3}), \\ & \vdots \\ & \times, (\alpha_{1}, \dots, \alpha_{k}), (\tau_{1}, \dots, \tau_{k}) \\ & \downarrow \\ f \\ & \rho_{k} \end{array}$$

check IP decision

 $\mathbf{V}_{\mathsf{IP}}(\mathbf{x},(\alpha_1,\ldots,\alpha_k),(\rho_1,\ldots,\rho_k))$
